

Milestone 2 Feature Report

Nouns Builder — before & after of the four Milestone 2 feature tracks

Funding context	Gnars DAO (Base) — Proposal 61: “Enhance the Official Builder Template and Upstream Feature Batches”, Milestone 2 of 3
Repository	BuilderOSS/nouns-builder (monorepo)
Branch	feat/m2-feature-tracks — over base c4a90bf (branch staging)
Changeset	Four feature tracks + a design-review polish pass and a post-feedback redesign of two components
Date	June 12, 2026
Team	r4topunk (implementation) · Vlad (@gnarlyvlad)

Executive summary

Milestone 2 delivers the four “lower-complexity” feature tracks committed in Proposal 61: a state-aware **voting power explanation** on proposal pages, **vote metrics visualizations** (quorum progress, vote timeline, participation history), **active member detection** in the members list, and **time-based urgency alerts** for the activity feed and dashboard. All four were implemented as reusable packages in the Nouns Builder monorepo with unit and component tests, no new runtime dependencies, no subgraph schema changes, and are bundled into a single upstream pull request.

Following a second round of stakeholder feedback, two refinements landed on top of that base: the urgency-alerts panel was **expanded from three deadline countdowns into a seven-kind taxonomy** — adding three neutral “info” signals (a proposal is ready to queue, ready to execute, or awaiting your vote) and a critical “auction has no bids” risk warning — so the strip answers “what needs doing in my DAO right now,” not just “what clock is running”; and the **Active member badge was reverted to its plain final form** — a light-green tint with bold dark text, no border and no dot — after the bordered/dotted treatment was rejected.

DESIGN REVIEW PASS

After implementation, the work went through a multi-lens UI review — per-track inspection, a WCAG 2.1 contrast audit, and a cross-feature consistency check — which raised **41 findings, 40 of which were verified and fixed** in commit 1190183. The fixes brought text to AA contrast (the explainer links, the Active badge, and the urgency countdown/body text), normalized casing (sentence-case “For” everywhere), and aligned the new components with the codebase’s design tokens and pill patterns. Accessibility was hardened with `aria-pressed` states on the filter buttons and labeled chart SVGs. Every “after” screenshot in this report shows the post-review UI.

POST-FEEDBACK REDESIGN

Following stakeholder feedback, two components were redesigned and are presented in their final form here:

- **QuorumProgress** was rebuilt as a self-contained card: a “Quorum” label paired with a status pill (a green-tinted “Reached” pill with a leading green dot once met, or a neutral gray “N to go” pill while below), a large primary-text hero count (“105 / 65 needed”) that is never colored green, a “% of quorum” readout, and a 12px pill-shaped track whose green fill is scaled to the quorum and clamped at 100% — with a thin marker and “Quorum N” label appearing at the right edge only while the threshold is unmet.
- The **Active badge** uses the shared StatBadge “positive” variant in its plain final form: a light-green (`positiveDisabled`) tint pill with bold dark “Active” text — **no border and no leading dot**. An earlier iteration added a hairline border and a 6px green dot; stakeholder feedback rejected that treatment, and the badge was reverted to match the app’s other status pills exactly, at AA contrast.

HOW THE SCREENSHOTS WERE PRODUCED

This report mixes two deliberately separated data sources:

- **Integration before/after shots use real on-chain data.** Both versions of the app were run locally against production data — **Before** is the `staging` branch (commit `c4a90bf`), **After** is `feat/m2-feature-tracks` . Because no Builder DAO had a proposal in its live voting window at capture time, on-chain reads for Base were pointed at an **Anvil fork of Base mainnet at block 45,445,327** — a block inside Gnars Proposal 61’s actual voting window — so the proposal page renders its genuine **Active** voting state. The voting-power states in these shots were captured with mock-connected wallets using **real Gnars member addresses**, so every value (vote weights, delegates, voter list) comes from live on-chain reads.
- **State galleries use simulated data.** To exhibit every component state deterministically — including states that depend on a specific deadline, delegation configuration or vote distribution that no single live proposal exhibits — the per-track galleries render each component with controlled inputs. Every gallery figure is labeled *Simulated data*.

Voting Power Explanation

What changed. The vote panel on proposal pages now renders a `VotingPowerExplainer` that tells the viewer, in plain language, what their voting power is *for this specific proposal* and what they can do about it. Previously the panel showed a single terse message (“You must hold at least one token to vote”) regardless of why the viewer couldn’t vote.

Why. Voting power in Builder DAOs is snapshot-based: what counts is the delegation state at the proposal’s creation, not current balances. This is the single most common source of governance confusion — especially for members who acquired a token *after* the snapshot and can’t understand why they’re unable to vote.

How it works. A pure, unit-tested decision tree (`getVotingPowerCase`) maps connection, delegation, ownership and snapshot state to one of six cases, each with specific copy and a contextual call-to-action:

State	What the viewer sees
Not connected	Prompt to connect a wallet to see their voting power
No tokens	How voting power works + link to the live auction
Tokens acquired after snapshot	Clear explanation of checkpoint voting with the snapshot date
Delegated away	Who currently holds their votes + link to update delegation
Delegate for others	Their aggregated voting power (own + delegated)
Can vote / already voted	Their vote weight, or their submitted vote and its weight

BEFORE LEGACY VOTE PANEL

The image shows a UI element for a legacy vote panel. It consists of a rounded rectangle containing a black button with the text "Submit Vote" and a line of text to its right that says "Connect your wallet to vote on proposals".

The entire legacy guidance on Gnars Proposal 61: a black “Submit Vote” button beside one generic line — “Connect your wallet to vote on proposals” — regardless of the viewer’s actual situation. Connected viewers without usable voting power got a similarly terse “You must hold at least one token to vote”.

AFTER VOTINGPOWEREXPLAINER — STATE-AWARE GUIDANCE (REAL ON-CHAIN DATA)

CAN VOTE — 0XCEED...D915 (42 VOTES)

You have **42 votes** available for Gnars

Connected as 0xCEED...D915, a Gnars delegate: the card reads “You have **42 votes** available for Gnars”, with the count bolded — the 42 votes are the address’s real voting power at the Proposal 61 snapshot, read on-chain. This positive “can vote” state carries no external link.

NO TOKENS — 0X1111...1111 (0 TOKENS)

You do not hold any Gnars tokens, so you cannot vote on this proposal. Win a token at auction to vote on future proposals.

[Bid in the current auction](#)

Connected as 0x1111...1111 holding no Gnars: the explainer states why voting is unavailable — “You do not hold any Gnars tokens, so you cannot vote on this proposal. Win a token at auction to vote on future proposals.” — in the darker text2 body copy from the contrast pass, and routes the viewer to the live auction with an underlined “Bid in the current auction” link.

DELEGATED AWAY — 0X05E1...2EDD → 0XDCE3...7A19

Voting power for this proposal was snapshotted on Apr 26, 2026 9:16 PM GMT -03:00. Your voting power was received after the snapshot, so it cannot be used on this proposal.

[Learn more about voting power ↗](#)

Connected as 0x05E1...2EDD: the card explains that this proposal’s voting power was snapshotted on Apr 26, 2026 9:16 PM GMT-03:00 and that the address’s voting power was received *after* that snapshot, so it cannot be used here — closing with an underlined “Learn more about voting power ↗” link carrying the external-link arrow icon. Body copy renders in the darker text2 tone from the contrast pass.

These states were captured with mock-connected wallets using real Gnars member addresses on Proposal 61 — the weights, delegate addresses and snapshot dates shown are live on-chain values, not fabricated data. A viewer with no wallet connected still sees the standard connect prompt, unchanged.

STATE GALLERY — ALL SIX CASES

Simulated data Each case rendered with controlled inputs so the full decision tree is visible at once; the three “after” shots above show three of these six states with real on-chain data.

NotConnected—wallet not connected

Connect your wallet to see your voting power for this proposal

Not connected

No wallet is connected — the viewer is prompted to connect to see their voting power for the proposal.

AcquiredAfterSnapshot—received votes after the snapshot

Voting power for this proposal was snapshot on Mar 14, 2026 1:00 PM GMT-3. You received your 3 votes after the snapshot, so they cannot be used on this proposal, but they will count on future proposals.

[Learn more about voting power ↗](#)

Acquired after snapshot

Tokens were received after the proposal’s snapshot date, so they can’t vote here but will count on future proposals.

CanVote—has snapshot voting power

You have **42 votes** available for Gnars

Can vote

The address has snapshot voting power and can vote — its weight is shown (“You have 42 votes available”).

NoTokens—holds no tokens, auction CTA

You do not hold any Gnars tokens, so you cannot vote on this proposal. Win a token at auction to vote on future proposals.
[Bid in the current auction](#)

No tokens

The connected address holds no DAO tokens — copy explains voting is unavailable and links to the current auction.

DelegatedAway—voting power delegated to another member

Your 4 votes are delegated to gnars.eth for this proposal.

[Update delegation](#)

Delegated away

The viewer’s votes are delegated to another member for this proposal, with an “Update delegation” link.

CanVoteWithDelegation—own + delegated voting power

You have **50 votes** available for Gnars, including 8 delegated to you by other members

Can vote (with delegation)

The address votes with its own plus votes delegated to it (“50 votes... including 8 delegated to you by other members”).

Vote Metrics & Visualizations

What changed. Proposal pages gain three visual metrics, all rendered as dependency-free custom SVG following the codebase’s existing chart pattern: `QuorumProgress` (accumulated For votes against the quorum threshold, redesigned post-feedback), `VoteTimeline` (cumulative for/against/abstain votes across the voting window, with a “now” cursor while active), and `ParticipationHistory` (participation rate across the DAO’s recent proposals).

Why. Voters and proposers previously had to parse raw tallies and the voter table to answer basic questions: Is this proposal on track to meet quorum? When did momentum arrive? Is participation trending up or down?

How it works. Chart math lives in a fully unit-tested helper; the components consume vote data already indexed by the subgraph (a `timestamp` field was added to the existing `ProposalVote` GraphQL fragment — an additive, backward-compatible query change, not a schema change). `QuorumProgress` renders inside the proposal details grid; the two charts render in the Votes tab.

BEFORE VOTE TALLY TILES ONLY

Baseline details grid: For (105) / Against (0) / Abstain (0) tiles with plain progress bars, plus the Threshold (65 votes), Ended (May 3, 2026) and Snapshot (#45229816) tiles. Quorum exists only as the static “65 votes” threshold number.

Baseline Votes tab: the voter participation summary (16.0% — 105 of 658 possible votes) followed directly by the flat voter list. No visual narrative of how or when the votes arrived.

AFTER QUORUM PROGRESS, VOTE TIMELINE AND PARTICIPATION HISTORY (REAL ON-CHAIN DATA)

The same details grid with the redesigned QuorumProgress card rendered beneath the For/Against/Abstain tiles: a “Quorum” label with a green-tinted “Reached” pill (leading green dot) on the right, a black hero count “105 / 65 needed”, a “162% of quorum” readout, and a full green pill-shaped bar (the fill clamps at 100% because For exceeds quorum, so no separate threshold marker is shown). The For tile keeps its sentence-case “For” label from the contrast pass.

105 out of 658 possible votes

● For 105 ● Against 0 ● Abstain 0

May 3, 2026 9:16 PM

4.76%

was promised feet pics

40.00%

more builders is good for Builder 1-2

2.86%

Lets Build

The Votes tab now opens with the participation summary (16.0% — 105 of 658) immediately followed by **VoteTimeline** — a labeled cumulative step chart (legend: For 105 · Against 0 · Abstain 0) of votes across the Apr 29 – May 3, 2026 window, the For line stepping up to 105 while Against/Abstain stay flat at zero. The real FOR voter list with comments follows, and the tab closes with **ParticipationHistory** (Prop #55 → Prop #64, with the latest proposal's bar highlighted black). Chart SVGs carry the accessibility labels added in the design review pass.

STATE GALLERY — QUORUMPROGRESS

Simulated data Five quorum scenarios, each rendered with controlled For/quorum values.

Below quorum

For votes are short of the threshold (26 / 65): neutral gray “39 to go” pill, partial green fill, and a marker + “Quorum 65” at the right edge.

Zero For votes

No For votes yet (0 / 65): empty track, “65 to go” pill, and the threshold marker fully exposed at the right edge.

Exactly met

For exactly equals quorum (65 / 65): green-tinted “Reached” pill with green dot and a full green bar; the marker disappears since the fill end is the threshold.

Exceeded

For exceeds quorum (105 / 65 = 162%): “Reached” pill and a full bar (the fill is clamped to 100%, so it cannot overflow).

No quorum required

The DAO sets quorum to zero: only the hero count (“12”) and a full bar render — no “/ N needed”, no marker.

STATE GALLERY — VOTETIMELINE

Simulated data The cumulative step chart across active, ended and sparse vote distributions.

Active (mid-window)

A proposal still open: mixed For/Against/Abstain step lines and a dashed “now” cursor marking the current moment inside the window.

Ended

A closed proposal: the full voting window with no dashed “now” line, the For line ending well above Against and Abstain.

Sparse

Only two votes cast (For 6 / Against 2): the chart still renders cleanly with a dashed cursor while the proposal is active.

STATE GALLERY — PARTICIPATIONHISTORY

Simulated data Turnout trends across the DAO’s recent proposals; the most recent proposal’s bar is highlighted black.

ParticipationHistory—rising trend (8 proposals)

Participation history

Share of token supply voting in recent proposals

Proposal #37

65.6% · 84 of 128 votes

100%

Prop #30

Prop #37

Rising trend

Eight proposals of climbing turnout, the latest the tallest (65.6% · 84 of 128 votes) — participation is trending up.

ParticipationHistory—falling trend (6 proposals)

Participation history

Share of token supply voting in recent proposals

Proposal #45

13.6% · 18 of 132 votes

100%

Prop #40

Prop #45

Falling trend

Six proposals of declining turnout, the latest the shortest (13.6% · 18 of 132 votes) — participation is trending down.

Participation history

Share of token supply voting in recent proposals

Proposal #51

64.0% · 64 of 100 votes

100%

Prop #50

Prop #51

Minimum (2 proposals)

The smallest chart the component renders — exactly two bars (latest 64.0% · 64 of 100 votes).

Active Member Detection

What changed. The members list now distinguishes engaged members from passive holders: an **Active** badge on member cards and an **All / Active** filter (with counts) in the list header.

Why. Token ownership says nothing about engagement. For delegation choices, treasury decisions and outreach, DAOs need to see at a glance who actually participates.

How it works. Activity is computed entirely client/API-side from data the subgraph already indexes — three queries total for the whole list (recent proposals, their votes, recent auction bids), not one per member. **Definition (configurable, pending DAO validation):** a member is *active* if they voted on at least one of the DAO’s last 5 completed proposals *or* placed an auction bid in the last 30 days. While activity data loads (or on error) the UI degrades gracefully: badges hide and the filter disables, leaving the original list untouched. **Badge treatment (final):** after one stakeholder iteration the Active badge settled on the plain shared StatBadge tint — a light-green fill with bold dark text, no border and no dot — matching the app’s existing status pills.

0x74f...e07B4	26 Tokens	3.95%	Mar 22, 2024

The same Delegates list with the new **All (176) / Active (18)** filter added before the Export CSV button — “All” shown selected in outline style (white fill with a dark border) and “Active” as a plain ghost option — and the **Active** badge in its final plain form (a light-green tint pill with bold dark text, **no border and no dot**) on members who voted in recent proposals or bid in the last 30 days. Here 0xCEED...AD915, 0xdcf...97a19 and 0x4bF...3bCc0 carry the badge; the others do not. Counts and badges are computed live from subgraph data at render time.

STATE GALLERY — BADGE AND FILTER

Simulated data The badge presence/absence and both filter selection states, rendered with controlled members.

Active member with ENS name

 gnars.eth **Active** 12 Tokens 4.21% Mar 14, 2024

Active member (ENS)

An engaged member resolves to an ENS name (gnars.eth) and shows the plain Active badge — light-green tint, bold dark text, no border or dot — beside it.

Active member with long ENS name (overflow / ellipsis test)

 thisisareallylongen... **Active** 3 Tokens 1.05% Jan 02, 2023

Active member (long ENS)

A long ENS name truncates with an ellipsis so the badge and columns stay aligned.

Inactive member (no Active badge)

 0x1111...1111 1 Token 0.35% Nov 28, 2022

Inactive member

A holder who hasn't voted recently or bid lately shows no badge — only their raw address.

Filter control — "All" selected (outline = active button)

All (128) Active (37)

Filter — All selected

The default view: "All (128)" in outline-selected style, "Active (37)" as a plain ghost option.

Filter control — "Active" selected (outline = active button)

All (128) **Active (37)**

Filter — Active selected

The filtered view: "Active (37)" outline-selected, restricting the list to engaged members.

Time-Based Feed Alerts

What changed. The dashboard pins an `UrgencyAlerts` strip above the activity feed. The strip was **expanded post-feedback from three deadline countdowns into a seven-kind taxonomy** spanning the auction and proposal lifecycles — so it answers “*what is happening in my DAO that needs my attention right now,*” not just “*which clock is running.*” Each alert carries a deep link to the resource and a session-scoped dismiss action; time-sensitive ones add a live countdown.

Why. The feed is chronological — it tells members what already happened, not what is about to expire or *what is stuck waiting on them*. Members miss votes and execution windows because nothing foregrounds time pressure; and high-leverage, currently-invisible states — a proposal that succeeded but nobody has queued, or one that is queued and executable but nobody has run — stall the DAO indefinitely with no surface anywhere in the app.

Design goal of the expansion. Turn the panel from a set of countdowns into a single “what needs doing” list. Three new **info** signals (neutral, no countdown) cover the proposal lifecycle gaps — *ready to queue, ready to execute, you haven’t voted* — and one new **critical** signal flags a pure-DAO-risk case: an auction about to end with *no bids* (the treasury earns nothing and the NFT can mint to the founder). Every new kind is a pure client-side derivation over fields the dashboard payload already carries — **zero new queries, zero new RPC, zero subgraph change**.

How it works. Alerts are derived client-side by `deriveUrgencyAlerts` from data the dashboard already fetches — no new subgraph events, no backend. **Thresholds (configurable, pending DAO validation):** warning under 24 hours, critical under 2 hours; info signals have no time threshold. Two suppression rules keep the list clean: `AUCTION_NO_BIDS` replaces the plain `AUCTION_ENDING` when the critical-window auction has zero bids, and `EXECUTION_EXPIRING` replaces `PROPOSAL_EXECUTABLE` for the same proposal. Alerts recompute on a 30-second interval and when a countdown ends, and stack in priority order: all critical, then all warning, then all info (newest first within info).

ALERT TAXONOMY — ALL SEVEN IMPLEMENTED KINDS

Kind	Trigger (client-derived from payload)	Level	CTA
<code>AUCTION_NO_BIDS</code>	Current auction ends within the critical window <i>and</i> has no bids (<code>highestBid == null</code>) — suppresses plain <code>AUCTION_ENDING</code>	critical	Bid
<code>AUCTION_ENDING</code>	Current auction <code>endTime</code> within warning (→critical under 2h) and has at least one bid	warning→critical	Bid
<code>VOTING_ENDING</code>	Active proposal, <code>voteEnd</code> within warning (→critical under 2h); shows a “You haven’t voted” chip when applicable	warning→critical	Vote
<code>EXECUTION_EXPIRING</code>	Queued proposal, <code>expiresAt</code> within warning (→critical under 2h) — suppresses <code>PROPOSAL_EXECUTABLE</code> for that proposal	warning→critical	Execute

VOTE_NEEDED	Active proposal, still open beyond the warning window, connected wallet has not voted — fires across the whole active window, not just the last 24h. No countdown; shows a static “ends in N days” line	info	Vote
PROPOSAL_EXECUTABLE	Queued proposal, <code>executableFrom ≤ now</code> , and no active <code>EXECUTION_EXPIRING</code> for it yet	info	Execute
PROPOSAL_QUEUEABLE	Proposal state <code>=== Succeeded</code> (stalls forever until someone queues it)	info	Queue

Baseline dashboard: a purely chronological activity feed (here, MAD BANANA DAO auction events on Base). Nothing distinguishes an auction ending in an hour from one that ended yesterday — and nothing surfaces a proposal stuck waiting to be queued or executed.

AFTER URGENCYALERTS STRIP — FULL SEVEN-KIND STACK (DEMONSTRATION DEADLINES, REAL DAO DATA)

! Auction has no bids Gnars DAO · Gnars #767	00h 59m 56s	×
! Auction ending soon Gnars DAO · Gnars #766	01h 29m 56s	×
! Voting ending soon You haven't voted Gnars DAO · Enhance the Official Builder Template and Upstream Feature Batches	19h 59m 56s	×
! Execution window expiring Gnars DAO · Fund the Q3 community grants round	05h 59m 56s	×
! You haven't voted Gnars DAO · Adopt the new contributor onboarding guide ends in 4 days		×
! Ready to execute Gnars DAO · Renew the core development retainer		×
! Ready to queue Gnars DAO · Sponsor a community art grant		×

The shipped `UrgencyAlerts` stack exercising every kind, in priority order. Two **critical** rows (red border + shadow, red icon, red countdown): “Auction has no bids” (Gnars #767, “00h 59m 56s”) and “Auction ending soon” (Gnars #766, “01h 29m 56s”). Two **warning** rows (amber border and icon, amber countdown): “Voting ending soon” on the Builder Template proposal — carrying the inline “You haven’t voted” chip and a “19h 59m 56s” countdown — and “Execution window expiring” (“05h 59m 56s”). Three **info** rows (neutral gray fill, gray icon, **no countdown**): “You haven’t voted” (with an “ends in 4 days” line), “Ready to execute”, and “Ready to queue”. The runtime `data-urgency-level` sequence reads `[critical, critical, warning, warning, info, info, info]`, matching the priority ordering. Titles stay bold/primary and descriptions neutral gray, all at AA contrast.

The capture above renders the shipped component with demonstration deadlines (auctions ending in ~1 h and ~1.5 h, a vote closing in ~20 h, an execution window expiring in ~6 h) plus the three info signals, since time-sensitive alerts only appear when a real deadline is near. In production the strip renders at the top of the dashboard feed for the connected wallet’s DAOs. `VOTE_NEEDED` additionally depends on a connected wallet, so it is exercised on the dedicated demo page rather than in the disconnected feed shot.

STATE GALLERY — EVERY ALERT KIND

Simulated data One figure per kind plus the full priority-ordered stack, rendered with controlled deadlines. These map 1:1 to the component tests, so the gallery doubles as visual regression.

AUCTION_NO_BIDS (critical)—auction ends in ~1h, zero bids

Auction has no bids
Gnars DAO · Gnars #767

00h 59m 56s

Auction has no bids (critical)

An auction ending in ~1 h with zero bids — pure DAO risk. Red border + shadow, red icon, red countdown. Suppresses the plain “ending soon” alert for the same auction.

AUCTION_ENDING (critical)—auction ends in ~1.5h, has bids

Auction ending soon
Gnars DAO · Gnars #766

01h 29m 57s

Auction ending soon (critical)

An auction ending in ~1.5 h that already has bids — red border and icon signalling the tighter window, red countdown.

VOTING_ENDING (warning)—voting ends in ~20h, not voted

Voting ending soon **You haven't voted**
Gnars DAO · Enhance the Official Builder Template and Upstream Feature Ba...

19h 59m 56s

Voting ending soon (warning)

A vote closing in ~20 h: amber border and icon, the inline “You haven’t voted” chip, and the countdown in primary text.

EXECUTION_EXPIRING (warning)—execution window expires in ~6h

Execution window expiring
Gnars DAO · Fund the Q3 community grants round

05h 59m 55s

Execution window expiring (warning)

A queued proposal whose execution window closes in ~6 h: amber border and icon, amber countdown. Suppresses the “Ready to execute” info alert for the same proposal.

VOTE_NEEDED (info)—unvoted active proposal, no countdown

You haven't voted
Gnars DAO · Adopt the new contributor onboarding guide
ends in 4 days

You haven't voted (info)

An open proposal the connected member hasn’t voted on — neutral gray fill, gray icon, **no countdown**, with a static “ends in 4 days” line. Fires across the whole active window, not just the last 24 h.

PROPOSAL_EXECUTABLE (info)—queued, ready to execute now

Ready to execute
Gnars DAO · Renew the core development retainer

Ready to execute (info)

A queued proposal past its executableFrom time — anyone can execute it now. Neutral fill, gray icon, no countdown.

PROPOSAL_QUEUEABLE (info)—succeeded, ready to queue

Ready to queue
Gnars DAO · Sponsor a community art grant

Ready to queue (info)

A succeeded proposal that stalls until someone queues it — high-leverage and previously invisible. Neutral fill, gray icon, no countdown.

Mixed stack—priority ordering critical → warning → info (newest info first)

Auction has no bids
Gnars DAO · Gnars #767

00h 59m 56s

Auction ending soon
Gnars DAO · Gnars #766

01h 29m 56s

ends in 4 days

Ready to execute
Gnars DAO · Renew the core development retainer

Ready to queue
Gnars DAO · Sponsor a community art grant

Priority-ordered stack

All seven kinds at once, ordered critical → critical → warning → warning → info → info → info (newest info first); each row independently dismissible.

FUTURE SIGNALS — DISCOVERY BACKLOG (NOT IMPLEMENTED)

Discovery mapped a wider set of possible signals against the dashboard payload. The following are **deliberately not shipped** in this milestone — surfaced here so the DAO can weigh in on which are worth a follow-up. They split into two buckets: ones that are client-cheap but need a

threshold/heuristic judgment call (*DAO-validate*), and ones that require new data or a server-side change (*backlog*).

Signal	Member value	Why held back	Bucket
Auction high bid below reserve	Auction would settle under reserve price	Reserve is often 0; only meaningful when a DAO sets it	DAO-validate
Voting opens soon (Pending proposal)	Prep delegation / voting power before the window	Delay window varies per DAO; risk of noise	DAO-validate
Voting just opened	“Go vote now” the moment it’s live	Overlaps “you haven’t voted”; low marginal value	DAO-validate
New proposal created (last 24 h)	Awareness of fresh governance activity	The Feed already shows PROPOSAL_CREATED ; triple-surfacing risk	DAO-validate
Quorum at risk	Active proposal trending to fail for lack of votes	Needs a defensible “soon + trending-to-fail” heuristic	DAO-validate
Auction ended → needs settlement	Next auction can’t start until settled	5-min cache race; settled field not selected → false positives	DAO-validate
Proposal executed (outcome news)	“Your proposal passed and ran”	Not in payload (filtered out); the Feed already shows PROPOSAL_EXECUTED	Backlog
Proposal defeated / vetoed / expired	Closure on something you voted on	Filtered out twice; needs a server-filter change or a new query	Backlog
Treasury / delegation events	Funds moved, delegation changed	No reachable subgraph entity from this payload — out of M2 scope	Backlog

The boundary between the free (shipped) and backlog signals is the server-side `ACTIVE_PROPOSAL_STATES` whitelist — proposals are filtered to `Pending/Active/Succeeded/Queued` before they reach the client, so proposal-outcome news needs either widening that whitelist (added per-proposal RPC cost + a contract change for the `DaoProposals` sidebar) or a new query. Everything shipped this round reads fields already present on every dashboard load.

Verification

Check	Result
pnpm build:packages	PASS — 19/19 tasks
pnpm type-check	PASS — 39/39 tasks (ui and dao-ui re-verified green at capture time)
New test suites	All green — feed-ui 26/26 · dao-ui 14/14 · hooks 24/24 · utils 126/126 · proposal-ui new components all passing (QuorumProgress 5/5, VoteTimeline 5/5, ParticipationHistory 4/4, VotingPowerExplainer 7/7 + helper 10/10, VotingPowerExplainerView 7/7)
Pre-existing failures	The same <code>storage.getItem</code> failures in shared test fixtures (<code>test-fixtures/src/utils.tsx</code>) fail identically on the base branch — verified unrelated to this changeset
Dependencies	No new runtime dependencies; only test tooling (<code>devDependencies</code>) added to feed-ui, mirroring the existing auction-ui setup
Per-track review	Each track was implemented on an isolated branch and passed an adversarial code review before integration
Design review pass (commit 1190183)	Multi-lens UI review (per-track + WCAG 2.1 contrast audit + cross-feature consistency) — 41 findings raised, 40 verified and fixed; zero regressions; tests and type-check green after fixes
Post-feedback redesign	QuorumProgress rebuilt as a status-pill card on shared design tokens; Active badge reverted to the plain shared <code>StatBadge</code> “positive” tint (no border, no dot) after the bordered/dotted iteration was rejected; <code>statBadgeActive</code> CSS and the dot/variant code removed, <code>StatBadgeProps.variant</code> narrowed back to <code>default positive negative accent</code> . Tests and <code>tsc</code> green at capture time
Alerts expansion (Track D)	UrgencyAlerts widened from 3 to 7 kinds (added <code>VOTE_NEEDED</code> , <code>PROPOSAL_EXECUTABLE</code> , <code>PROPOSAL_QUEUEABLE</code> , <code>AUCTION_NO_BIDS</code>) plus two suppression rules, an <code>info</code> level variant, and priority ordering — all pure client-side derivation, zero new query/RPC/subgraph/dep. Tests: feed-ui UrgencyAlerts 49 passed (32 helper + 17 component); dao-ui <code>MembersList</code> 7 passed . <code>tsc --noEmit</code> clean for feed-ui, dao-ui, ui and apps/web (39/39 — the badge union narrowing flows safely into Dashboard)

Every component ships with colocated tests; thresholds for active-member detection and urgency alerts are parameterized so the DAO can tune them without code changes.
